Classification of Flow Measurement Devices

The core of the handbook is its detailed examination of different flow measurement devices, categorized based on operational principles:

1. Differential Pressure Devices

1. Orifice Plates: Widely used due to simplicity and low cost; measures flow by creating a pressure drop across a thin plate.
2. Venturi Tubes: Similar in concept but with smooth converging-diverging shapes, offering lower energy losses.
3. Flow Nozzles: Compact and suitable for high-velocity flows, often used in power plants.

1. Velocity-Based Devices

1. Electromagnetic Flow Meters: Rely on Faraday’s law; ideal for conductive fluids like water and slurries.
2. Ultrasonic Flow Meters: Use sound waves; suitable for clean or dirty liquids without contact with the fluid.
3. Turbine and Paddlewheel Meters: Mechanical devices that measure velocity directly.

1. Mass Flow Meters

1. Coriolis Meters: Directly measure mass flow and density; offer high accuracy and are suitable for a wide range of fluids.
2. Thermal Mass Flow Meters: Measure the heat transfer from a heated element to infer flow rate, often used for gases.

1. Other Techniques

1. Positive Displacement Meters: Capture a fixed volume of fluid per cycle, ideal for custody transfer.
2. Optical and Laser-based Devices: Emerging technologies leveraging laser Doppler velocimetry.

Each device type has specific advantages, limitations, and ideal application scenarios. Miller provides detailed performance characteristics, installation guidelines, and calibration procedures to assist engineers in device selection.
