Questions & Answers About naming alkenes and alkynes worksheet

No	Question	Answer
1	What is the basic rule for naming alkenes using the IUPAC system?	Alkenes are named by identifying the longest carbon chain containing the double bond, suffixing with '-ene,' and indicating the position of the double bond with a number, such as 'but-2-ene'.
2	How do you determine the position of a triple bond in an alkyne when naming it?	The position of the triple bond is indicated by the lowest numbered carbon involved in the bond, starting from the end of the chain that gives the lowest possible number, and the suffix '-yne' is used.
3	What is the difference between cis- and trans- alkenes in their names?	Cis- and trans- are prefixes used to specify the relative positioning of substituents around a double bond; 'cis-' indicates the groups are on the same side, while 'trans-' indicates they are on opposite sides.

4	When naming substituted alkenes or alkynes, how are the substituents numbered and named?	Substituents are numbered based on the position of the double or triple bond, and their positions are indicated by the lowest possible number. The substituents are named and prefixed to the parent chain, with their position numbers included.
5	Why is it important to specify the position of the double or triple bond in alkene and alkyne names?	Specifying the position of the double or triple bond ensures clarity and precision in identifying the exact structure of the compound, especially when multiple isomers are possible with different arrangements of bonds.
