Introduction to the Fetal Pig as a Model Organism

The fetal pig, or Sus scrofa domesticus in its developmental stage, is an embryonic form of the domestic pig, typically used in educational settings for dissection and anatomical studies. Its relevance extends beyond classroom use, as it closely resembles human physiology in many respects, making it an ideal model for biomedical research. Why Study the Fetal Pig? - Anatomical Similarity to Humans: Many organs and systems in the fetal pig are structurally and functionally comparable to those in humans, especially during developmental stages. - Accessible Anatomy: The fetal pig’s relatively small size and

preserved developmental features make it easier to study than adult specimens. - Developmental Insights: Studying the fetal pig provides a snapshot of mammalian embryogenesis, including organogenesis and tissue differentiation.

The Fetal Pig as a Placental Mammal

Definition and Characteristics of Placental Mammals

Placental mammals, or eutherians, comprise the largest group within the class Mammalia. Their defining feature is the presence of a complex placenta—a specialized organ that facilitates nutrient, gas exchange, and waste removal between mother and fetus during gestation. Key Characteristics of Placental Mammals: - Placenta Development: A highly vascularized organ formed during pregnancy that connects the mother's blood supply to the developing fetus. - Extended Gestation: Longer developmental periods within the womb compared to monotremes and marsupials. - Live Birth: Most placental mammals give birth to live, relatively well-developed young. - Fetal Development: The fetus is nurtured within the uterus, receiving oxygen and nutrients directly through the placenta.

Developmental Features of the Fetal Pig as a Placental Mammal

The fetal pig exhibits hallmark features of placental mammals: - Placental Connection: The pig develops a chorioallantoic placenta, which allows for efficient maternal-fetal exchange. - Amniotic Sac: The fetus is encased within an amniotic sac containing amniotic fluid, providing cushioning and a controlled environment. - Vascular Systems: The development of a complex circulatory system to support rapid growth and organogenesis.

Embryonic Development of the Fetal Pig

Stages of Development

The development of the fetal pig can be broadly divided into distinct stages: 1. Fertilization and Zygote Formation: Fusion of sperm and egg, resulting in a single-celled zygote. 2. Cleavage and Blastocyst Formation: Rapid cell division producing a multicellular blastocyst. 3. Implantation: Blastocyst embeds into the uterine wall, establishing the foundation for placental development. 4. Embryonic Stage: Major organs and systems begin to form, including the heart, spine, and limbs. 5. Fetal Stage: Growth and maturation of organs, leading to a fully formed fetus ready for birth. Timing in Development: - Gestation in pigs lasts approximately 114 days. - Embryonic development begins shortly after implantation. - The fetal pig studied in laboratories is typically in the late fetal stage, around 45-60 days of gestation.

Key Developmental Structures

- Placenta: Forms from trophoblastic tissues, establishing nutrient and waste exchange pathways. - Amniotic Sac: Surrounded by amniotic membranes; filled with fluid to protect the developing fetus. - Umbilical Cord: Connects the fetus to the placenta, facilitating transfer of nutrients, gases, and wastes.

External and Internal Anatomy of the Fetal Pig

External Anatomy

The external features of the fetal pig include: - Snout: Used for rooting and exploration. - Limbs: Small but distinguishable forelimbs and hindlimbs. - Tail: Small tail at the posterior end. - Ears and Eyes: Developing sensory organs that are less prominent than in adult pigs.

Internal Anatomy and Organ Systems

Dissection of the fetal pig reveals the development of major organ systems: 1. Circulatory System - Heart: Located centrally in the thoracic cavity, with four chambers—two atria and two ventricles. - Blood vessels: Major arteries and veins such as the aorta, vena cava, and pulmonary arteries. 2. Respiratory System - Lungs: Developing structures that will eventually facilitate gas exchange after birth. - Trachea: The windpipe leading to the lungs. 3.
