1000 Solved Problems In Heat Transfer

1000 solved problems in heat transfer serve as an invaluable resource for students, educators, and engineers aiming to deepen their understanding of heat transfer principles and their practical applications. This extensive collection of solved problems covers a wide spectrum of topics within heat transfer, including conduction, convection, radiation, and phase change phenomena. By studying these problems, learners can develop strong problem-solving skills, reinforce theoretical concepts, and prepare effectively for exams and real-world engineering challenges.

Introduction to Heat Transfer and Its Importance

Heat transfer is a fundamental aspect of thermal engineering that involves the movement of thermal energy from one point to another. It plays a crucial role in designing heating and cooling systems, thermal management in electronics, energy conversion devices, and environmental control systems. Mastering heat transfer requires a solid grasp of both theoretical principles and practical problem-solving techniques, which is why solving numerous problems is essential.

Categories of Heat Transfer Problems

Understanding the different modes of heat transfer and their unique characteristics helps in categorizing problems effectively. The main modes include:

Conduction

Conduction involves heat transfer through a solid material due to temperature gradients. Problems often involve calculating heat flux, temperature distribution, or thermal resistance.

Convection

Convection entails heat transfer between a solid surface and a moving fluid (liquid or gas). Problems typically focus on calculating heat transfer coefficients, Nusselt numbers, or heat transfer rates.

Radiation

Radiation involves energy transfer via electromagnetic waves. Problems here may involve blackbody radiation, emissivity, view factors, and net radiative heat exchange.

Phase Change and Combined Modes

Many practical problems involve phase changes like melting,

boiling, or condensation, often combined with conduction or convection.

Structured Approach to Solving Heat Transfer Problems

A systematic approach enhances problem-solving efficiency and accuracy. The typical steps include:

1. Understanding the problem and identifying the mode of heat transfer involved.
2. Drawing a clear diagram with all given data and assumptions.
3. Listing knowns and unknowns.
4. Applying relevant heat transfer equations and principles.
5. Performing calculations step-by-step, checking units and magnitudes.
6. Verifying the reasonableness of the result.

Sample Problem Types and Solutions

Below are representative examples of problems from each category, illustrating typical questions and their detailed solutions.

Conduction Problems

Example 1: Steady-State Heat Conduction through a Wall

Problem: A 10 cm thick brick wall separates two rooms. The indoor temperature is 22°C, and the outdoor temperature is 2°C. The thermal conductivity of the brick is 0.72 W/m·K. Calculate the heat flux through the wall. Solution: - Convert thickness: $L = 0.10\, m$ - Temperature difference: $\Delta T = 22 - 2 = 20\, °C$ - Thermal conductivity: $k = 0.72\, W/m·K$ Using Fourier's law: $$ q = -k \frac{\Delta T}{L} = 0.72 \times \frac{20}{0.10} = 0.72 \times 200 = 144\, W/m^2 $$ Answer: The heat flux through the wall is 144 W/m².

Convection Problems

Example 2: Cooling of a Hot Plate in Air

Problem: A hot plate at 150°C is exposed to air at 25°C. The convective heat transfer coefficient is 25 W/m²·K. Determine the rate of heat loss from a 0.5 m × 0.5 m square plate. Solution: - Temperature difference: $\Delta T = 150 - 25 = 125\, °C$ - Area: $A = 0.5 \times 0.5 = 0.25\, m^2$ Heat transfer rate: $$ Q = h \times A \times \Delta T = 25 \times 0.25 \times 125 = 25 \times 31.25 = 781.25\, W $$ Answer: The rate of heat loss is approximately 781.25 W.

Radiation Problems

Example 3: Radiation Exchange Between Two Surfaces

Problem: Two parallel surfaces, each with an area of 2 m², are

facing each other at a distance of 1 m. Surface 1 has an emissivity of 0.8 and temperature of 600 K, while Surface 2 has an emissivity of 0.6 and temperature of 300 K. Determine the net radiative heat transfer between them. Solution: - Use the Stefan-Boltzmann law and view factors. - For parallel surfaces facing each other, view factor $F_{12} = 1$. Net radiative heat transfer: $$ Q_{net} = \sigma \times \frac{T_1^4 - T_2^4}{(1/\varepsilon_1) + (1/\varepsilon_2) - 1} \times A $$ Where: $\sigma = 5.67 \times 10^{-8}\, W/m^2·K^4$ Calculate numerator: $$ T_1^4 = 600^4 = 1.296 \times 10^{11} $$ $$ T_2^4 = 300^4 = 8.1 \times 10^{9} $$ Difference: $$ 1.296 \times 10^{11} - 8.1 \times 10^{9} \approx 1.214 \times 10^{11} $$ Denominator: $$ (1/0.8) + (1/0.6) - 1 = 1.25 + 1.6667 - 1 = 1.9167 $$ Calculate Q: $$ Q_{net} = 5.67 \times 10^{-8} \times \frac{1.214 \times 10^{11}}{1.9167} \times 2 $$ $$ Q_{net} \approx 5.67 \times 10^{-8} \times 6.34 \times 10^{10} \times 2 \approx 5.67 \times 10^{-8} \times 1.268 \times 10^{11} $$ $$ Q_{net} \approx 7.2 \times 10^{3}\, W $$ Answer: Approximately 7200 W of net radiative heat transfer occurs between the surfaces.
