Sample UVA Family Medicine Questions and Analysis

To illustrate their depth and practical relevance, here are sample questions along with detailed analyses: Example 1: Pediatric Screening Question: A 2-year-old child is brought in for a routine check-up. Which of the following is the recommended screening test at this age? A) Lead poisoning screening B) Hemoglobin electrophoresis C) Developmental screening using ASQ (Ages and Stages Questionnaire) D) Tuberculosis skin test Correct Answer: C) Developmental screening using ASQ Analysis: While lead screening (A) is recommended in certain populations, it is not universal at age 2. Hemoglobin electrophoresis (B) is typically for sickle cell screening in at-risk groups. Tuberculosis testing (D) is generally based on exposure risk, not routine at this age. Developmental screening (C) is recommended universally at 18 and 24 months to identify delays, making it the best choice here. Example 2: Hypertension Management Question: A 55-year-old man with a BMI of 32 kg/m² presents with blood pressure readings of 138/85 mm Hg on two separate visits. He has no other significant medical history. According to current guidelines, what is the next step? A) Initiate antihypertensive medication B) Recommend lifestyle modifications and recheck BP in 3 months C) Start statin therapy D) Order 24-hour ambulatory BP monitoring Correct Answer: B) Recommend lifestyle modifications and recheck BP in 3 months Analysis: This patient falls into the category of Stage 1 hypertension but does not meet the criteria for pharmacologic treatment unless other risk factors are present. Lifestyle modifications are first-line, with re-evaluation in 3 to 6 months. Initiating medication (A) is premature here. Statin therapy (C) is unrelated to BP management unless lipid levels are high. Ambulatory monitoring (D) may be useful in resistant cases or white-coat hypertension but isn't the immediate next step.
